

Veya

Make space for the people who matter.

A practical guide to the product, its purpose, the core journey, and the key mobile experience checks.

IN ONE SENTENCE

Veya privately helps trusted contacts reconnect when their availability and preferred way of connecting naturally align.

What Veya is, and what it is not

The product removes timing and initiation friction without turning relationships into a public feed.

MISSION

Help people maintain meaningful relationships by making it effortless, private, and timely to reconnect when both people have space.

VISION

Become the trusted availability layer for personal relationships: understand when someone is open to connection, identify the right person in their existing circle, obtain mutual consent, and hand the conversation to a channel people already use.

Three frictions Veya addresses

Timing

Knowing when free time overlaps.

Initiation

Knowing whether reaching out is welcome.

Planning

Avoiding long scheduling exchanges for a simple call or chat.

Product boundaries

- Invite-only and centred on people the user already knows.
- Not a dating app, friend-discovery network, public availability broadcast, or full calendar.
- Availability windows are shared; raw calendar content is not.
- A suggestion is not a connection: both people must consent.
- Veya hands accepted matches to WhatsApp instead of becoming another inbox.

How Veya creates a reconnection

The app stays deliberately narrow: express intent, find an overlap, ask, agree, then talk.

1

STAGE 1

Build a trusted circle

Invite a registered Veya user by phone number or accept an invitation.

2

STAGE 2

Share availability

Add a weekly routine, a temporary change, or use Free now for immediate intent.

3

STAGE 3

Receive a suggestion

Veya computes relevant overlap and respects chat/call matching preferences.

4

STAGE 4

Propose and consent

One person proposes; the other accepts or declines. Nothing connects automatically.

5

STAGE 5

Continue in WhatsApp

After acceptance, open WhatsApp to start the conversation.

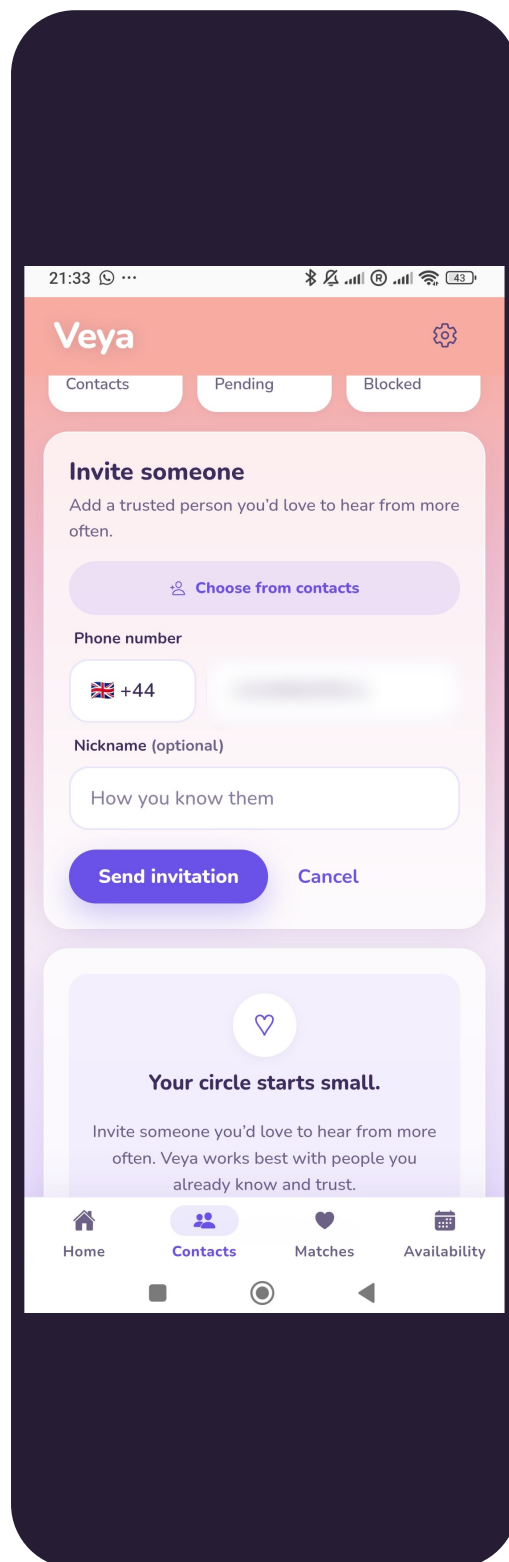

Create a useful circle

Use two accounts on separate devices whenever possible; the main journey depends on reciprocal actions.

- 1 Sign in or register**
 Complete the assigned onboarding flow. A verified/usable phone number may be required before proposing or accepting a match.
- 2 Open Contacts**
 Use the bottom tab bar. Tap Invite a contact, then choose one contact or enter a number manually.
- 3 Send the invitation**
 Confirm the country code and number, add an optional nickname, and send. The invitee must already have a Veya account in this phase.
- 4 Accept on the second account**
 Check Pending invitations. Accept to create the trusted contact relationship.
- 5 Manage the circle**
 Exercise nickname, favourite, remove, block, unblock, and error/retry states as assigned.

PRIVACY CHECK

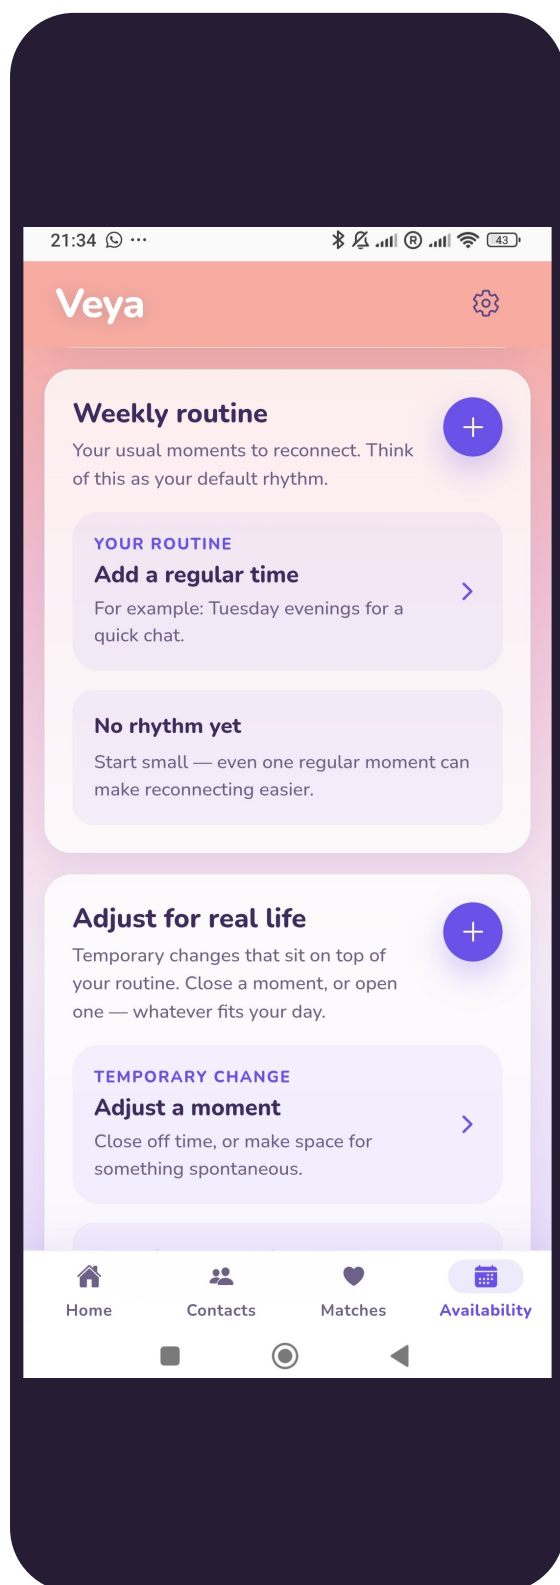

The native picker should return only the selected person. Veya should not import, scan, cache, or upload the full address book.

The example phone number in the supplied screenshot has been blurred in this guide.

Share a rhythm, then adjust for real life

Availability is selective intent, not a copy of the user's calendar.

WEEKLY ROUTINE

Use + to add a regular day, start/end time, and preferred channel: Chat or Call. This becomes the default rhythm and appears in the effective weekly preview.

TEMPORARY CHANGE

Use Adjust a moment to close off time or make space for something spontaneous. Overrides sit on top of the weekly routine and should update the preview.

FREE NOW

From Home, tap Free now to signal immediate openness to reconnect. Confirm the card changes state and that the assigned build handles refresh/relaunch as expected.

What to verify

- Invalid or overlapping times show useful feedback.
- Edits and deletions update the effective week.
- Chat/call channel and timezone are reflected correctly.
- Failed saves keep the user's entered values visible.

From an overlap to a real conversation

Matches are based on compatible availability and mutual agreement. An empty state can be correct when no eligible overlap exists.

SUGGESTED MATCHES

Review the person, channel, and any available overlap/strength details. Tap Propose. Duplicate, expired, blocked, low-score, missing-overlap, and missing-phone outcomes should be explained cleanly.

MATCH REQUESTS

On the candidate account, open Matches and accept or decline. A stale request should refresh rather than leave an invalid action on screen.

ACCEPTED MATCHES

After acceptance, both required consents exist and the match appears in Accepted matches. Open its detail and confirm the displayed name and channel are correct.

WHATSAPP HANDOFF

Tap Open WhatsApp after both people agree to reconnect. The action should open the expected conversation without exposing contact details elsewhere in the app.

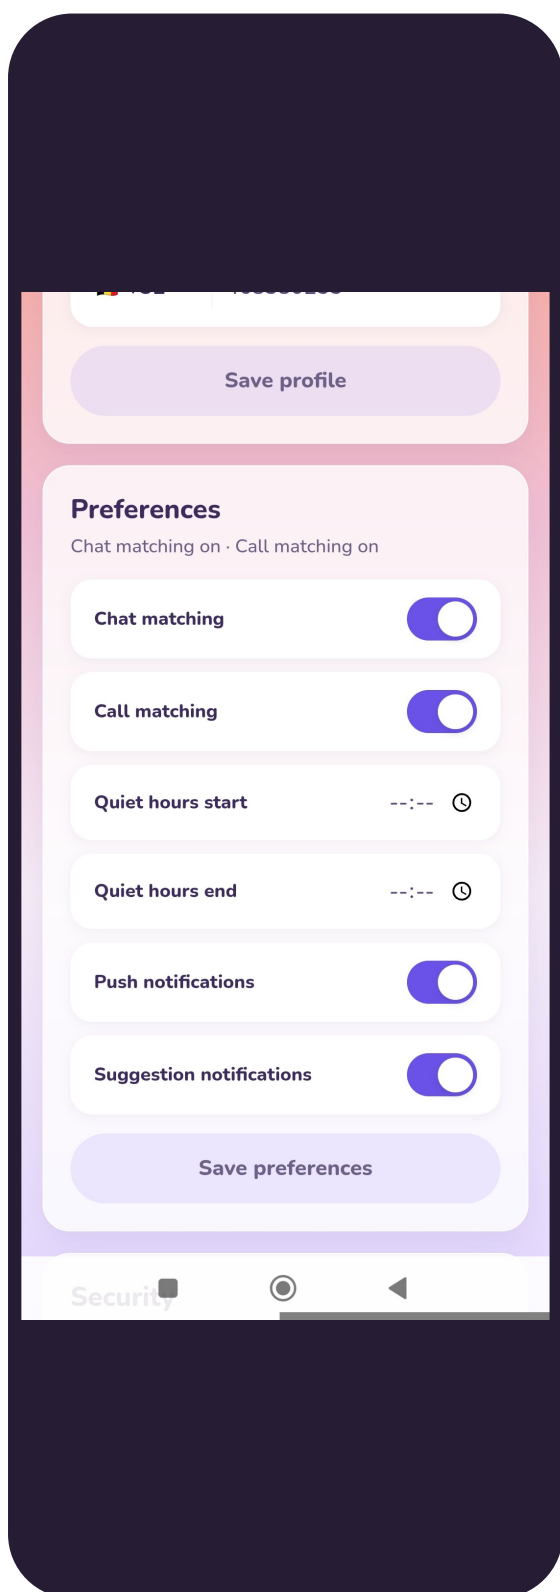

Fast two-device walkthrough

- 1 A and B accept each other as contacts.
- 2 Both enable the same channel and create overlapping availability.
- 3 A sees B as a suggestion and sends a proposal.
- 4 B receives/opens the request and accepts.
- 5 Both see the accepted match; handoff opens the expected WhatsApp destination.

If no suggestion appears, first check accepted contact state, actual time overlap, matching channel preferences, timezone, and whether the data refreshed.

Preferences and notification delivery

Veya records account preferences, while the operating system controls whether this device can receive alerts.

MATCHING

Chat matching and Call matching determine which types of reconnection are eligible. Turn on the channel used in your scenario, then tap Save preferences.

QUIET HOURS

Set a start and end time to reduce unwanted interruptions. Check boundary times and timezone changes; quiet hours should not silently corrupt the underlying match state.

NOTIFICATIONS

Push notifications expresses the account-level preference. Suggestion notifications controls suggestion alerts. Neither switch proves that this phone's operating system has granted notification permission.

IMPORTANT DISTINCTION

Account preference and device permission are separate states. A user can enable push inside Veya while Android or iOS still blocks this particular device.

Verify OS-level permission on each device

Menu wording varies slightly by device and OS release; these are the current official paths and reliable alternatives.

ANDROID

Settings > Notifications > App notifications > Veya

- Turn Veya notifications on. If categories are shown, enable the categories needed for the event.
- Alternative path on many devices: Settings > Apps > Veya > Notifications.
- For visible and audible alerts, ensure the category is not set to Silent and banners/pop-ups are permitted where available.
- Temporarily disable Do Not Disturb/Modes. Battery optimisation can delay delivery even when permission is enabled.

PASS: Veya is ON

IPHONE / IOS

Settings > Apps > Veya > Notifications

- Turn on Allow Notifications.
- Choose at least one alert location: Lock Screen, Notification Centre, or Banners. Sounds and Badges are optional unless required.
- Alternative path: Settings > Notifications > Veya.
- Temporarily disable Focus and use immediate delivery instead of Scheduled Summary when checking arrival time.

PASS: ALLOW IS ON

If Veya is missing from the OS list

Open Veya > Settings. Keep Push notifications enabled. On iOS, use Enable notifications on this device if shown, then accept the system prompt. If permission was previously denied, iOS normally will not show the prompt again. Use the Settings path above. Return to Veya after changing permission so the app can refresh device state and register the token.

Delivery verification

1

Background Veya

Do not force-stop it. Lock the phone or open another app.

2

Trigger a real event

Use the second account or the agreed tool to create a suggestion/proposal/acceptance notification.

3

Observe and tap

Record arrival time, title/body, badge/sound if relevant, and the screen opened after tapping.

4

Confirm the destination

The notification should open the correct screen and show the current information.

A concise end-to-end checklist

Capture enough context for another person or developer to reproduce the result.

ENVIRONMENT

- ☐ Build/version and installation source
- ☐ Device model and OS version
- ☐ Account IDs or safe aliases (never passwords)
- ☐ Network type and timezone

CORE JOURNEY

- ☐ Register/sign in and complete phone setup
- ☐ Invite, accept, edit, favourite, block/unblock
- ☐ Create weekly availability and a temporary override
- ☐ Exercise Free now
- ☐ Propose, accept/decline, open accepted match
- ☐ Verify WhatsApp handoff

NOTIFICATIONS

- ☐ Push enabled in Veya
- ☐ OS permission enabled on each device
- ☐ Foreground, background, and notification-tap behaviour
- ☐ Focus/DND and quiet-hours conditions recorded

QUALITY

- ☐ Loading, empty, error, and retry states
- ☐ Input survives failed saves
- ☐ No unexpected private phone/calendar data shown
- ☐ Navigation remains usable after errors

FOR EVERY DEFECT

Record: expected result / actual result / exact steps / account role / timestamp and timezone / screenshots or screen recording / reproducibility / network state / whether retry or relaunch changed the result.

Avoid copying real phone numbers, notification tokens, passwords, or private contact details into issue trackers.
